

CRB-G with Nudi-virus detection and comparative analysis to coconut tree damage at multiple sites in Palau.

Christopher Kitalong, PhD, Justin Omak Ramarui, David Mason Ramarui, Joel Miles, PhD

Nudi-virus was initially detected in Guam biotype CRB specimens from pheromone trap collections at multiple sites in Palau in 2016. Damage assessments were also completed in 2016. After a year, a more thorough collection of CRB from multiple sites located near damage assessment sites was conducted to compare damage to populations of CRB to see if there are correlative relations between infected CRB and CRB-G samples and levels of damage.
